

# An extra layer of security with new-gen air purifiers

One of the two newly-launched models

**D**aikin's two new air purifiers, launched globally and available in India, offer utmost safety as a result of modern technology. Daikin's patented Streamer Discharge Technology provides an extra layer of security to your health. The streamer discharge generates high speed electrons, which combine with Oxygen and Nitrogen to create active species with a strong oxidative decomposition power to eliminate viruses and allergens such as moulds, mites, pollen, and hazardous chemical substances such as formaldehyde.

The Active Plasma Ion Technology releases ions into the air, which combine with particles to form species with strong oxidising power like OH radical. They decompose proteins in the air and reduce allergens, fungi, bacteria, and odour. They also deodorise ammonia and increase moisture, thus offering a double layer of protection.

The Electrostatic HEPA Filter is a high-performance filter that removes 99.97% fine particles and dust. It collects a large amount of dust with electrostatic forces and, unlike unelectrified HEPA filters, it isn't prone to clogging. This allows a larger amount of air to pass through the filter while taking in dust and pollutants from three different directions.

The Deodorising Filters removes all unpleasant odours from the room, letting you breathe in fresh air comfortably.

"These next-gen features make our air purifiers, the ideal choice for a safe environment that protects yourself and your loved ones," says KJ Jawa, MD & CEO, Daikin India.
